And if you want to start your day off right, we also offer a complete and free download of the Deskbabes Desktop Backgrounds Collection, a day, knowing where they fit into a logical life trajectory. Conclusions ===== The results of this study provide the first data on the sociodemographic characteristics of adult women patients with ME/CFS, illustrating that this patient group has a higher proportion of Caucasian women than the general population. The prevalence of female patients was significantly higher in urban compared to rural areas. The most common symptoms and diagnoses in this study were musculoskeletal symptoms (67.2%) and neurocognitive symptoms (30.9%), with fatigue and depression being the most common diagnoses. The results suggest that the ME/CFS health care system has been accepting of new patients but less accepting of new diagnoses; it may be useful to provide support for patients with ME/CFS to improve their ability to disclose their symptoms
