## Solidsquad 2015

-11-07 Scott, Thank you for the reply. I guess I didn't really get across exactly what I was asking. I'm not asking about that. I'm asking about a situation when somebody is trying to understand what an error is that they're seeing. If I give you a numpy array, say "a", and you tell me the error that you see, can you tell me what the error is? I guess that's kind of

a weird question. Thanks, Steven. That's why it was so important to me to have something more concrete. It seems like you are talking about the context in which a problem is occurring, not the problem itself. Or are you saying that the problem is the error? solidsquad 2015-11-07 I'm not sure if I understand this question. It's one of those questions where I could talk forever and I still don't know what you're getting at. Scott.

Thanks Scott. I figured that out. But that really isn't the question. I guess I mean if somebody is looking at a problem and they are trying to understand what the error is, do you have a clear "this is what it is" answer, or do you have to give more detail about the problem? I've recently been doing some contract work for a company where they are having trouble making their Numpy code work. They are using Windows, and I was wondering if maybe I could help? I was thinking of looking over the source code and writing some Python code to do what they want. But what I'm wondering is, since I have no prior knowledge of how this stuff works, how do I know what the heck to do with the source code I'm looking at? I don't know how to tell what it is they want. Hi Steven, Your best bet is to talk to the developers of the code. Generally, you have no idea what the developer wants. You might be able to guess by looking at the code. But if you don't understand what they are doing, your best bet is to ask them what they are trying to accomplish. OK, so I'll have to talk
